**Annotation:** *This paper investigates the impact of social media language on the academic English proficiency of Uzbek university students. It explores how informal language features commonly used in social media platforms influence students' writing and communication in academic contexts. The study examines both positive and negative effects, including increased language exposure and potential interference with formal language norms. Based on surveys and language assessments, the paper discusses implications for English language teaching and suggests strategies to balance informal digital communication with academic language skills.*

**Keywords:** *social media language, academic English, Uzbek university students, language influence, informal language, language proficiency, English language teaching*

The pervasive use of social media among university students worldwide has significantly affected language use, particularly in English as a foreign language contexts. In Uzbekistan, where English is a key academic and professional language, students frequently engage with social media platforms that encourage informal and abbreviated language styles. This exposure impacts their use of academic English, both positively by increasing overall language contact, and negatively by introducing colloquial expressions, slang, and non-standard grammar. Understanding the influence of social media language on academic English proficiency is crucial for educators aiming to develop effective teaching methods. This paper aims to explore the nature of this impact among Uzbek university students and propose pedagogical approaches to support balanced language development.

Social media platforms such as Instagram, Facebook, Twitter, and TikTok have become integral parts of daily communication for university students in Uzbekistan. These platforms encourage rapid, informal exchanges often characterized by slang, abbreviations, emojis, and unconventional grammar. As a result, the language students use on social media differs significantly from the formal standards expected in academic English writing and speaking. This divergence raises concerns about how social media language influences students' academic English proficiency.

One of the primary effects of social media on students' language use is the increased exposure to English in informal contexts. Many Uzbek students interact with global audiences and consume English content online, which can enhance vocabulary acquisition, listening skills, and overall language familiarity. This increased contact with English

provides authentic contexts for language use, which traditional classroom settings may lack. Consequently, social media can act as a supplementary language input source, fostering motivation and engagement among learners.

However, the informal nature of social media language can interfere with students' ability to adhere to academic English norms. Academic English demands clarity, precision, and adherence to grammatical rules, whereas social media language often embraces brevity, ambiguity, and playful creativity. For example, students might adopt abbreviated forms like "u" instead of "you," or use slang terms that are inappropriate in academic writing. These habits can transfer unconsciously into essays, reports, and presentations, resulting in language errors and reduced academic rigor.

The frequent use of emojis and non-verbal cues in social media communication further complicates this issue. While these elements enhance expressiveness and emotional tone in casual exchanges, they are inappropriate in formal academic discourse. Students accustomed to relying on such cues may struggle to convey nuance and tone effectively through academic writing, which relies solely on verbal language.

Moreover, the blending of multiple languages or code-switching, common on social media among bilingual Uzbek students, may also affect academic English proficiency. Mixing Uzbek or Russian words and structures with English in informal contexts can lead to interference in academic work. This phenomenon, while natural in multilingual settings, requires careful management to maintain the standards of academic English.

The impact of social media language on academic English also varies depending on students' language proficiency levels. Those with stronger foundations in English are better equipped to differentiate between informal and formal language styles. Conversely, students with limited proficiency may find it challenging to switch registers appropriately, resulting in academic texts peppered with colloquial expressions and non-standard grammar.

Teachers and educators face the challenge of addressing these influences in their instruction. One effective approach is raising students' **awareness** of the differences between social media language and academic English. Explicit teaching about register, style, and audience expectations can help learners navigate between informal and formal contexts. For example, contrastive analysis exercises comparing social media posts with academic texts can highlight appropriate language use.

Incorporating digital literacy into the curriculum is another strategy. Educators can guide students in critically evaluating language use online and encourage reflective practices about how digital communication affects their academic skills. Assignments that require students to rewrite informal social media texts into formal academic language can provide practical experience in code-switching.

Additionally, leveraging social media positively can support academic language development. Teachers might use platforms like blogs, discussion forums, or educational social media groups to create authentic yet controlled environments for academic language

practice. These contexts allow students to apply formal language skills in interactive settings that mirror their digital habits.

Assessment practices should also consider the influence of social media language. Providing targeted feedback on register, vocabulary choice, and grammatical accuracy helps students recognize and correct informal language intrusions. Encouraging peer review sessions can foster collaborative learning and critical evaluation of language use.

It is important to recognize that social media language is not inherently detrimental. Its creative and dynamic nature reflects contemporary communication trends and can enhance students' linguistic flexibility and cultural awareness. The goal is not to eliminate informal language but to cultivate students' ability to use language appropriately across different contexts.

In conclusion, social media language exerts a significant influence on Uzbek university students' academic English proficiency. While it offers valuable exposure and engagement opportunities, it also poses challenges related to formality, grammar, and clarity. Through deliberate pedagogical interventions focusing on awareness, digital literacy, and practice, educators can help students balance the benefits of social media language with the demands of academic English. This balanced approach prepares learners for effective communication in both academic and real-world settings.

The influence of social media language on Uzbek university students' academic English is a multifaceted phenomenon. While social media provides increased exposure to English and opportunities for informal language practice, it also introduces linguistic habits that may conflict with academic language norms. Challenges such as the use of slang, abbreviations, emojis, and code-switching can interfere with students' ability to produce clear, formal academic writing. Educators must address these challenges by raising students' awareness of register differences, integrating digital literacy into curricula, and designing activities that foster the appropriate use of language across contexts. Embracing the dynamic nature of social media language while emphasizing academic standards will enable learners to communicate effectively in both informal and formal settings.
